Gastric Emptying Scan
How to prepare

This handout explains how to prepare for a gastric emptying scan, how it works, how it is done, what you may feel during the scan, and how you will get your results.

What is a gastric emptying scan?
A gastric emptying scan (GES) is a nuclear medicine exam that uses a radioactive material that you will eat in a meal. You will eat this meal in the Nuclear Medicine department before your scan. The radioactive material allows doctors to see how your stomach empties.

This scan is used to help diagnose conditions called motility disorders. These are conditions that change the way the stomach contracts and moves food into your intestines. A GES is a form of radiology, because radiation is used to take pictures of your body.

How does the scan work?
A gamma camera takes pictures as the radioactive food moves through your stomach. The camera detects the gamma rays emitted from the food. A computer then produces pictures and measurements of your stomach.

How do I prepare?
- You will need to fast (not eat or drink anything) for 6 hours before the scan.
- If you smoke, do not smoke the morning of the test and during the hours of the scan.
- If you are a woman and you are still menstruating, it is best to have your scan done in the first 10 days of your menstrual cycle.

A gamma camera will take pictures as the radioactive food moves through your stomach.
Medicines and Drugs

Do Not Take

- Do not take any laxatives the day before or at any time during the test.
- For at least 2 days before your test, do not take these drugs unless your doctor tells you otherwise:
  - Prokinetic agents that speed up the motility of your GI tract such as domperidone (Motilium), erythromycin, metoclopramide (Reglan), and tegaserod (Zelnorm)
  - Anticholinergic antispasmodic agents that slow down the motility of your GI tract such as Bentyl, Donnatal, Hyosyne, Levsin, and Robinul
  - Opiate analgesics (pain medicines) such as codeine, demerol, Fentanyl patch, methadone, morphine, Oxycontin, Percocet (oxycodone), Tylenol Percodan, #3, Tylox, Vicodin (hydrocodone), and Ultram (tramadol)
  - Marijuana

Call the Nuclear Medicine department at 206.598.4240 if you have any questions about how certain drugs will affect this test.

OK to Take

It is OK to take these medicines on the day of your test:

- Relaxants (benzodiazepines) such as Ativan, Valium, Librium, Xanax, and others
- Anti-nausea medicines (phenothiazines) such as Thorazine, Compazine, Phenergan, and others
- All other prescribed medicines

If you take medicines on the day of your test, take them:

- With small sips of water
- At least 2 hours before your test begins

If You Have Diabetes

On the day of your test:

- Your fasting blood glucose should be less than 200 mg/dL. A technologist will check your blood glucose before your test starts.
- Please bring your insulin or other diabetes medicines with you. You may need to take it with your gastric emptying meal.
How is the scan done?

- If you have severe nausea on the day of your test, we may give you medicine to reduce your nausea.
- We will give you 2 small sandwiches, one filled with jam and one filled with 4 cooked egg whites that have been injected with a small dose of radioactive material. We will ask you to eat the sandwiches and drink water within 10 minutes. The egg will taste like a regular egg. If you are allergic to eggs or wheat, tell the person you schedule your appointment with. We will give you a different meal to eat.
- After you eat, we will ask you to lie flat on your back while the gamma camera takes a picture of your stomach. You must lie still when the camera is taking pictures. If you move, the pictures will be blurry and may have to be taken again.

What will I feel during the scan?

Lying still on the exam table may be hard for some people. The technologist will help make you comfortable.

How long will the scan take?

From start to finish, your gastric emptying scan will take about 4 hours. There are 4 parts to the test:

- **First half hour:** Eat meal, take pictures (pictures take 5 minutes)
- **1 hour after meal:** Take pictures (5 minutes)
- **2 hours after meal:** Take pictures (5 minutes)
- **4 hours after meal:** Take pictures (5 minutes)

After eating the meal:

- You may leave the Nuclear Medicine department between the times you have the pictures taken.
- **Do not eat or exercise** until after the last set of pictures has been taken.

Who interprets the results and how do I get them?

When the test is over, the Nuclear Medicine doctor will review your images, write up a report, and talk with your provider about the results. Your provider will talk with you about the results.

You may also read your results on your eCare Results page. If you need copies of your images on disc, call 206.598.6206.

You and your provider will decide the next step, such as treatment for a problem, as needed.
